

Crank lifts for heavy beams

Description

The crank lifts do the work of lifting and positioning a heavy beam in a construction site. The worker no longer uses the legs and back to handle the beam. It reduces the need for lifting in residential building construction.

This equipment is available for rent from equipment rental stores

The new method.

- Use crank lifts to lift and position the beam
- Rental cost: \$88 for two lifts
- May reduce heavy lifting; requires job specific training

The old way.

Manually lifting those heavy beams (weigh 500 – 800 lbs) can cause back injury

*Maximum weight allowed in the Ergonomics rule is 90 lbs
