

# Position pallets to slide items across

Reduces heavy, awkward and frequent lifting

## Description

Many jobs require moving items on and off pallets, which can require a lot of heavy lifts in awkward positions. Rather than lifting to make the transfer, use a forklift or stacker to place the pallets close together and at the same height. Objects can then be moved by sliding them between the pallets, with no lifting required.

With the pallets set at the same height, heavy objects can be slid across rather than lifted.
